

ALLERGY TESTING & TREATMENT

Eliminate
the need for
out-sourced
allergy
testing and
wait time
on results.

Our new partnership with Allergy Services of America, LLC (ASA) enables us to offer a complete spectrum of allergy testing and immunotherapy to our patients. All testing and treatment will be performed in our state of the art allergy testing clinic by our Clinical Allergy Coordinator (CAC).

Your physician may recommend allergy skin testing to identify specific allergens that are causing your symptoms. Skin testing is generally performed by pricking your skin with allergen extracts to evaluate the skin reaction to the allergen.

TREATMENTS

Allergen Immunotherapy

This type of treatment is the only form of therapy for allergic disease that can lead to complete resolution of symptoms without medications and, when administered to children, may prevent the development of further allergic disease.

Subcutaneous Immunotherapy (SCIT)

SCIT is commonly known as "allergy shots" and is the most effective treatment available for symptoms caused by exposure to specific allergens.

Sublingual Immunotherapy (SLIT)

SLIT is commonly known as "allergy drops" and is an alternative treatment for allergy shots. This allows the patient to place drops of allergen extracts under their tongue. SLIT is painless and can be administered by the patient at home.
